

SECURE SOLUTION FOR SSL VPN

As more businesses and organisations appreciate the needs and benefits of flexible working, there is an increasing demand for remote access to systems using an SSL VPN. Networks are vulnerable from the use of user name and password combinations to authenticate access. Token based solutions also have their weaknesses, so the right authentication technology is essential to protect computer data.

The Swivel Solution

Swivel Secure supports flexible working with the cutting edge security solution, PINsafe. Swivels award winning multi-factor authentication solution is designed to defend against hostile threats from keyboard logging, phishing dangers and identity theft. It is a strong authentication technology which can be used by companies and organisations of all sizes, in all markets and government sectors, including e-businesses.

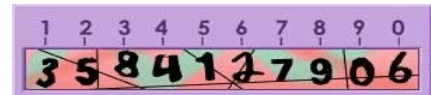

The Pinsafe Protocol and Flexibility

PINsafe works by sending a random 10 digit security string to the user through a mobile device or web browser. A One-time Code (OTC) is extracted from the string by the user reading off the digits corresponding to their registered PIN.

PINsafe is flexible and can be tailored to meet the individual needs of any customer with any of three interface options; sending SMS messages to a mobile phone to

deliver the security string, using Java enabled mobile devices which downloads a simple Java application via a GPRS connection or website access that uses an obfuscated image to display the security string.

Key Features

- Easy to set up and deploy
- A tokenless solution- no additional device to buy, deploy or manage
- A low cost option - A one time license fee, No renewal required.
- Flexibility - Multi factor authentication.
- Strong security, credentials protected during login. No keying in of a static pin.
- No phone signal needed.
- Optional user interfaces to suit a wide range of applications and user preferences.
- Server software available as a dedicated Network Appliance.
- No client side software or special hardware requirements.
- Minimum management and maintenance
